

FarmConnect Admin Functionality Speech

Generated 2026-05-23

Good [morning/afternoon], everyone. Today I will walk you through the FarmConnect admin functionality, focusing on how it helps us run the marketplace safely, efficiently, and with full accountability.

The admin role is the control center of the platform. Access is restricted to administrators, and every action is logged so we can trace decisions and maintain trust. This is critical for a marketplace that connects producers and buyers at scale.

Let us start with the Admin Dashboard. This is the quick health check of the business. It shows total users with a breakdown by buyers, producers, and admins. It also shows product totals and how many are actively listed. For operations, it highlights total orders and pending orders, and it shows paid revenue to summarize platform performance. Finally, a recent orders table provides immediate visibility into current activity.

Next is User Management. Admins can search by name or email and filter by role or status. This lets us find specific accounts quickly, whether we are supporting a buyer, investigating a producer, or reviewing a complaint. Admins can reactivate, suspend, or ban accounts when needed. This is governed by policy and every change is auditable. Admin accounts are protected so that one admin cannot moderate another in this panel.

Producer Verification Review is one of the most important admin workflows. Producers submit verification requests with business details and supporting documents. Admins review these requests, check the submitted information, and then approve or reject with notes. Approvals unlock the producer status, and rejections provide a clear reason for resubmission. The system tracks the reviewer and timestamps to maintain accountability.

Product Moderation ensures the catalog remains safe and accurate. Admins can search by product title, slug, or producer name. They can view pricing, stock, and status for each item. If there are policy violations or data issues, admins can change product status to draft, inactive, out of stock, or archived. Archiving removes the product from public listings while preserving the record.

Orders Monitoring is used for operational oversight. Admins can filter orders by order status or by payment status. The list shows buyer identity, item counts, totals, and timestamps. This is the place to detect unusual activity, resolve disputes, or escalate delivery issues.

Reports Moderation handles community feedback and safety. Users can report products, orders, or other users. Admins review these reports, track their status from open to resolved or rejected, and add internal notes for context. This ensures disputes are handled consistently and documented for future reference.

Audit Logs are the backbone of accountability. Every key admin action is recorded with the actor, target, action type, IP address, and timestamp. This allows us to prove decisions, investigate incidents, and maintain compliance with internal policies.

Security is built into every step. Admin endpoints require authentication and an admin role, and unauthorized requests are blocked. This prevents privilege abuse and keeps sensitive operations

protected.

In summary, the admin functionality provides visibility, control, and accountability across the entire marketplace. It supports safe onboarding, trusted transactions, and responsive issue handling. With these tools, administrators can keep FarmConnect reliable for both producers and buyers.

Thank you. I am happy to answer any questions.
